1 | Cell Membrane

Fluid mosaic model

Some Phosopholipids connected as a “phosolipid bi-layer” (see [KBhBIO101StructuresOfLipids] structure

- Charged head
- Nonpolar tail

So, head aligns and tail aligns, creating the basic structure of the membrane:

Stuff in the membrane

Cholesterol

Helps cells communicate

Proteans - Makes sure the right molecules gets in/out - Nonpolar Oxygen + CO2 could easily get through - Polar and charged molecules can’t get through, unless… - Channeled proteins let specific polar particles through - Cell Transport => how chemicals get in + out of the cell - Passive diffusion - Passive Passive diffusions => nonpolar things simply “fall in” - Facillitated diffusions => polar molecules selectively get throgh protean channels - Active transport - ATP sheperds elements in
- Bulk transport across the plasma membrane occurs by exocytosis and endocytosis.
