1 | Cell Membrane

Fluid mosaic model

Some Phospholipids connected as a “phospholipid bi-layer” (see [KBhBIO101StructuresOfLipids](#) structure

- Charged head
- Nonpolar tail

So, head aligns and tail aligns, creating the basic structure of the membrane:

Figure 1: Screen Shot 2020-09-09 at 3.08.10 PM.png

Stuff in the membrane

Cholesterol - Cells communicates - Proteans - Makes sure the right molecules gets in/out - Nonpolar Oxygen + CO₂ could easily get through - Polar and charged molecules can't get through, unless... - Channeled proteins let specific polar particles through - Cell Transport => how chemicals get in + out of the cell - Passive diffusion - Passive Passives diffusions => nonpolar things simply “fall in” - Facillitated diffusions => polar molecules selectively get throgh protean channels - Active transport - ATP sheperds elements in - Bulk transport across the plasma membrane occurs by exocytosis and endocytosis.
