1 | Meet the Leptons

- There are three families of subatomic particles
 - Flavor 1: the electron and it's neutrino
 - Flavor 2: the Muon and it's neutrino
 - Flavor 3: the the tau lepton and it's neutrino
- Leptons carry one-half unit of spin and are either neutral or have 1 negative charge
- For every lepton there's an anti-lepton with an opposite unit of charge and the same mass
- Leptons have no known size and in all theories describing them are point particles

1.0.1 | Electrons

- Electrons are Leptons
- Has an opposite which is the positron
- Effectively launched particle physics as we know it
- Is beta radiation
- Equations to bridge relativity and quantum mechanics in order to describe the electron predicted 1/2 spin and also anti-matter
 - Some particles are their own anti-particles

1.0.2 | Radioactivity

- They realized that helium nucleus's shouldn't be able to escape the nucleus of a particle and that it would have to escape through quantum tunneling
- Gamma radiation is produced by a change in quantum state of the protons
- Neutrino was suggested as a way to solve some of beta decay's issues
-
