

So, let's begin with a very easy concept (sarcasm)

1 | What is life?

When is someone dead?

This is hard, so let's instead think about what a child?

Biological Female + Sperm + relative safety + Lot's of Peanut Butter => Child.

But! We know that:

- The person does not consciously go "let's create a liver", for instance
- Instead... She is following **self organization rules**
 - Pieces self organize
 - Put some chemistry into some matter, and it will organize to create a human being
- These **self organization rules**...
 - Does not need to be taught
 - Is innate to system
 - Is on both the micro and macro level
 - Micro => Cells functioning
 - Macro => Flock of birds

Self Organization Rules

Simple structures causes intricate, complicated behavior.

See [\[KB20200825165225\]](#), self-organization.

Types of Biology

- Translational
- Academic
- Textbook
- Education

Textbook Biology

- Journalized and formalized
- "Sum total of bio knowledge"

Academic Biology

- Scientific pursue of information
- Synthesis and discovery of information

Translational Biology

- Research with outcome in mine
- Trying to solve "a problem"

Educational Biology

- Sharing and communicating biology
- Luke De :heart: Edu Biology
- Like...
 - Convincing people to have vaccines
 - Convincing mask wearing

Think: **how would I share this information**
