1 | Carbohydrates

Glucose, Cellulose, Lactose, etc. etc.

Structures of Carbs

- Carbs have **6 carbons**.
- Carbon chain with Hydrogen and Hydroxide
- Dissolves well in water because of the slightly positive hydrogen and the slightly negative OH

So, if you see a hexagon carbon ring, you are probably looking at a carbohydrate

You could take many “simple sugars” (glucose, for instance) and chain them to build wonderfully complicated things (fiber!). To see how that happens: [KBhBIO101StructuresofCarbs](#)

Uses of Carbs

- Mitochondria
 - Actually not strictly part of a cell!
 - Another organism (technically an organelle)
 - Could move
 - Could replicate
 - Breaks down stored carbs (glycogen) into glucose and then eventually smaller elements
- Cell tagging
 - As an authentication systems
 -

The Carbs Debate

- Fructose worse? Better? No difference?
- Experiments differ
 - Generally found no differences
 - Some found fructose to be a bit more obesity causing
