# 1 | Bio-Molecules Quiz Review

#disorganized

## 1.1 | Paul's Review Sheet

... is here

### 1.1.1 | Carbohydrates

- Set 1, carbs. See Luke De's video + [KBhBIO101Carbs](#)
  - *Glucose vs. fructose* — both monosaccharides, one is a 6-carbon ring and one is a 5-carbon ring
  - *Mono vs. di. vs. polysaccharide* — carbohydrates made out of a single, double, and multiple monomer (single-unit) carbohydrates
  - *Starch vs. glycogen vs. cellulose* — lots of alpha glucose in less branches, lots of alpha glucose in more branches, lots of beta glucose in organized lattice respectively.
    - Starch — plant food reserve
    - Glycogen — animal energy reserve
    - Cellulose — cell wall in plants
- Set 2, lipids. See Luke De's video + [KBhBIO101Lipids](#)
  - *Triglyceride vs. fatty acid vs. phospholipid* see [KBhBIO101StructuresofCarbs](#)
    - Glycerol => a fatty acid
    - Triglyceride => three of 'em above
    - Phospholipid => two fatty acid + phosphate head
  - *Saturated vs unsaturated fatty acids* see also [KBhBIO101StructuresofCarbs](#)
    - Saturated Fats => no double bonds in the carbon chain of fatty acids — think! butter
    - Unsaturated Fats => double bonds in the carbon chain of fatty acids — think! olive oil
- Identify functional groups
  - Amino acid groups — see [KBhBIO101AminoAcids](#)
    - carboxyl —  $\text{O}=\text{C}-\text{R}-\text{OH}$
    - carboxylic acid —  $\text{H}-\text{O}-\text{C}=\text{O}$  (left side of backbone)
    - carbonyl —  $\text{C}=\text{O}$  — part of carboxyl
    - amide —  $\text{RC}(=\text{O})\text{NR}'\text{R}''$  (frequently shown in side chains of amino acids — see Amine)
    - amino/amine —  $\text{H}_3\text{N}^+$  (right side of backbone)
    - hydroxyl —  $\text{OH}$  group. Need I say more?
    - ester — take a carboxylic acid and replace the hydrogen with a  $\text{R}-\text{O}$  group #ASK
    - ether —  $\text{R}-\text{O}-\text{R}$  structure. Commonly shown as an alcohol group ( $\text{H}-\text{O}-\text{C}$ ) as part of the carboxyl
- Monomers vs Polymers [KBhBIO101StructuresofCarbs](#)
  - Monomer — single molecule (such as a monosaccharide) that could be chained together to make polymers
  - Polymers — complex molecules built from monomers
  - Building polymers — dehydration reaction — taking out water molecules
  - Destructing polymers — hydration reaction — adding in water molecules

### 1.1.2 | Cell Structures

- Prokaryotic vs. Eukaryotic
  - Prokaryotic cells — often in single-cellular cells, has a cell wall, and contained in capsules
  - Eukaryotic cells — in multicellular cell elements, contains a plasma membranes and nucleus
- Compare and contrast a typical animal cell with a typical plant cell. Be able to label diagrams of each. (See... problem set 1)
  - Animal Cell
    - No cell wall
    - No chloroplast
    - Has Cytoplasm
    - Has Ribosomes
    - Has Mitochondria
    - No plastids — organelle pigments
    - Has Cilia — Hair-like items on the outer surface
  - Plant Cell
    - Has cell wall
    - Has chloroplast — photosynthesis
    - Has cytoplasm
    - Has Ribosomes
    - Has Mitochondria
    - Has plastids — organelle pigments
    - Mostly has no Cilia
- Endosymbiotic theory
  - Endosymbiotic theory states that organelles within our current eukaryotic cells — the mitochondria and chloroplasts — are originally prokaryotic cells in their own right. This is because they divide independently through binary fission, and also contains circular DNA that is independent of the main cell itself.
- Organizing organelles based on membranes #ASK
  - Membranous organelles — possess own plasma => regulates own macromo

## 1.2 | Helpful review items

Bonding in organic compounds, a review.

Common nonpolar bonds

Carbon-carbon  
Carbon-hydrogen  
Carbon-sulfur

Common dipole interactions

Carbon-nitrogen  $\delta^+ - \delta^-$     Carbon-oxygen  $\delta^+ - \delta^-$   
Nitrogen-oxygen  $\delta^+ - \delta^-$     Hydrogen-oxygen  $\delta^+ - \delta^-$

Common ionic interactions

they come from acid-base interactions.

However, sometimes they are permanent. Look at the amino acid chart for those.

Why hydrogen bonding is excellent

Hydrogen bonding allows stronger dipole-dipole bonds than dipole-dipole bonds. They are still good ol covalent bonds.

These bonds basically combines Hydrogen w the most electronegative atoms.

Reading a line-angle representation.

In this type of representations, start with a line. End the line at every carbon.

Now, it is assumed that carbon is not going to just be happy with  $\text{C}-\text{C}-\text{C}-\text{C}$ .

So, we still the missing orbitals with hydrogen.

need 2  $\text{C}-\text{C}-\text{C}-\text{C}$  need 3  
need 3 need 2
