Robustness, Reliability, Overdetermination

Starts with quote about how philosophy should emulate the scientific method.

This is incorrect. Philosophy is about building a logical framework of understanding. Science is about finding things out about the real world through experimentation. These two subjects and approaches are **fundamentally** incompatible (Godel's theory, perception bias, forgot the name of the theory but extended simulation theory).

Our truth is the intersection of independent lies.

Common Features of Concepts of Robustness

Robustness analysis
