1 | **Can we get back to coding**

please? yaow.

- Privacy
 - Good ml requires lots of data, so inherent leads to violation
 - Also, algorythm predicts private things?
 - Target example.
- Bias
 - Our model has bias built into them
 - ex. prop 25
 - get rid of bail, and use ml to identify flight risks
 - has bias in the model due to a biased dataset
 - Input bias -> output bias
