

1 | **Axler5.22 matrix of an operator, $\mathcal{M}(T)$ def**

Suppose $T \in \mathcal{L}(V)$ and v_1, \dots, v_n is a basis of V . The *matrix of T* wrt this basis is the n -by- n matrix

$$\mathcal{M}(T) = \begin{pmatrix} A_{1,1} & \cdots & A_{1,n} \\ \vdots & \ddots & \vdots \\ A_{n,1} & \cdots & A_{n,n} \end{pmatrix}$$

whose entries $A_{j,k}$ are defined by

$$Tv_k = A_{1,k}v_1 + \cdots + A_{n,k}v_n$$

Specify a basis with $\mathcal{M}(T, (v_1, \dots, v_n))$

1.1 | **intuition**

1.1.1 | **each column is where the map takes a basis vector**

1.2 | **foreshadowing**

1.2.1 | **'A central goal of linear algebra is to show that given an operator $T \in \mathcal{L}(V)$, there exists a basis of V wrt which T has a reasonably simple matrix'**
