1 | Carbohydrates

Glucose, Cellulose, Lactose, etc. etc.

Structures of Carbs

- · Carbs have 6 carbons.
- · Carbon chain with Hydrogen and Hydroxide
- · Dissolves well in water because of the slightly positive hydrogen and the slightly negative OH

So, if you see a hexagon carbon ring, you are probably looking at a carbohydrate

You could take many "simple sugars" (glucose, for instance) and chain them to build wonderfully complicated things (fiber!). To see how that happens: [KBhBiO101StructuresofCarbs]

Uses of Carbs

- · Mitocondria
 - · Actually not strictly part of a cell!
 - · Another organism (technically an organelle)
 - · Could move
 - · Could replicate
 - · Breaks down stored carbs (glycogen) into glucose and then eventually smaller elements
- Cell tagging
 - · As an authentication systems

•

The Carbs Debate

- · Fructose worse? Better? No difference?
- Experiments differ
 - · Generally found no differences
 - · Some found fructose to be a bit more obesity causing
