## 2 | Exercise 7

Suppose  $T \in \mathcal{L}(V)$  has a diagonal matrix A with respect to some basis of V and that  $\lambda \in \mathbb{F}$ . Prove that  $\lambda$  appears on the diagonal of A precisely dim  $E(\lambda, T)$  times.

## 3 | **Proof**

We will show that for each eigenvalue  $\lambda$ , there are at least  $E(\lambda,T)$  occurrences of that eigenvalue and at most  $E(\lambda,T)$  occurrences.

Suppose  $\dim E(\lambda,T)=m$  and  $v_1,\ldots,v_m$  is a basis of  $E(\lambda,T)$ . In the diagonal matrix, the column corresponding to each of the m eigenvectors is comprised of the coefficients of

$$Tv_j = \lambda v_j$$

Thus,  $\lambda$  appears on the diagonal at least m times.

Suppose  $\lambda$  is on the diagonal m times. Each of those occurrences corresponds to where the diagonal matrix sends a (linearly independent) basis eigenvector, which implies that the basis of V has at least m eigenvectors corresponding to  $\lambda$ . These m eigenvectors can be extended to a basis of  $E(\lambda,T)$ , implying that  $\dim E(\lambda,T) \geq m$ .

## 3.1 | TODO Suppose $\lambda$ is on the diagonal m times. show that there are at most dim E(;I, T) occurances on the diagonal
