## Source: [KB20200825125900]

- · Discussion Results: what is a number?
  - Something about group theory
    - This is more like a way of telling us how to use numbers, not really a good definition.
    - Set up bounds to define things
  - Different classes (natural, real, imaginary)
  - · Where do you draw the boundaries between objects?
  - · A way to quantify the nature of living and reality
- Number Systems
  - · We want them to be desirable and group-like
  - Types

## Natural Numbers

- Integers greater than zero
- · Whole Numbers
  - · Natural Numbers + 0
  - 0 is the hole.
- · Integers
  - { ..., -2, -1, 0, 1, 2, ... }
  - Good for algebra, we'll see later
- Rationals
  - Like  $\frac{1}{2}$ .
  - · A ratio/fraction/quotient of integers
- · Real
  - Like  $\pi$
  - · A number on the number line
    - · A number that can be a distance to something.
    - A good enough definition that isn't "real analysis"

## · Complex Numbers

- Like 5*i*
- There will be many complex numbers
  - · Matrices with complex numbers can be different from real numbers
- · Complex plane
- Hamaltonian numbers music video? #curiosity
- · Why do we want more numbers?
  - · Why Zero?
    - · Additive identity
      - Zero vector = identity vector
      - · Frame of reference, starting point, nice and neutral
  - · Zintegers?
    - · Why negatives?
      - · So you can make zero
      - Undo each other, undo a +5
      - Inverse
        - -a and a are additive *inverses*
- That's all we need to get to a group: [KB20200825134500]
