Source: [KBhBIO101Viruses]

1 | Types of Viruses

1.1 | Prokarotic infecting viruses

- · Variety of shapes
- · Complex and prolate shapes
- · Has, sometimes complex shapes! a la this image

1.2 | Eukarotic infecting viruses

- · Much more "boring" in terms of shape
- · Icosahedral/spherecial outside
- Enveloped constructions => envelope protein layer outside, spherical inside
- · Helical/Cylindrical/Bullet shapes, too!
- Often single patterns assemble together to create symmetric shape that creates the whole of the virus
