1 | **Algebreic and Geometric Multiplicities**

I missed the last ten minutes of class and had to look up what the algebreic and geometric multiplicities are. I used this source.

Also it says something about

It is a fact that summing up the algebraic multiplicities of all the eigenvalues of an $n \times n$ matrix A gives exactly n.

Which reminds me of the fundamental theorem of algebra…

1.1 | $\begin{pmatrix} 4 & -12 \\ 2 & 0 \end{pmatrix}$

1.1.1 | **Geometric multiplicity**

The null space is span $\begin{pmatrix} 1 \\ 1 \end{pmatrix}$ which is dimension 1.

1.1.2 | **Algebraic multiplicity**

The determinant of $\begin{pmatrix} 2 & -2 \\ 2 & -2 \end{pmatrix}$ is

$$(4 - \lambda \cdot -2) - (2 \cdot -\lambda) = 0$$

which makes sense because the matrix is singular.
