Source: README

1 | **Howdy**

Howdy. I exist to remind @Exr0n how they intended to use Taproot. Feel free to take a look around.

Naming

Processed files (including notes, annotated documents, anything that was modified) should be named in the format `[KBe]`-{course}-{type}-{title}:

Variable	Description	Example
`{course}`	The course code	`2020math401`
`{type}`	The file type	(see below)
`{title}`	A descriptive title, almost a set of keywords; **separated by underscores**	`calc_intro`

File `types` should be one of the following:

Type	Description
`src`	Any unmodified document designed for static reference, especially handouts and readings.
`flo`	A processed flow of some resource, such as notes from a lecture, a completed worksheet, or annotated reading.
`ref`	A digested, compiled, and consolidated reference focusing on getting the important points across.
`ret`	Something to be exported to the outside world, such as an assignment to be graded.
`index`	The "default" file for any topic. Should link to everything else. **Don't add a `{title}`!**

Don't forget to add a tag demarcating the file type in addition to the type in the name!
