2.1 | **a: skipped**

2.2 | **find maclaurin series for** $f'(x)$ **where** $f(x) = \sum_{k=0} \frac{(2x)^{k+1}}{k+1}$

$$\frac{d}{dx} \frac{(2x)^{n+1}}{n+1} = \frac{\cancel{(n+1)^2}(2x)^n(2)}{\cancel{(n+1)^2}} = 2(2x)^n$$

So, our series is just

$$\sum_{k=0} 2(2x)^k = 2 + 4x + 8x^2 + 16x^3 + \cdots$$

2.3 | **estimate** $f'\left(-\frac{1}{3}\right)$

$$2 + 4\frac{-1}{3} + 8\left(\frac{-1}{3}\right)^2 + 16\left(\frac{-1}{3}\right)^2 = \frac{10}{3}$$

3 | **page 4**

3.1 | **find** $1 - \frac{x^2}{3!} + \frac{x^4}{5!} - \frac{x^6}{7!} + \cdots$

That series is just the taylor series for

$$f(x) = \frac{\sin x}{x}$$

So the derivative at zero is zero, and the second derivative:

$$\frac{d}{dx}\frac{x\cos x - \sin x}{x^2} = \frac{x^2\left(-x\sin x + \cos x - \cos x\right) - (x\cos x - \sin x)(2x)}{x^4}$$
$$= \frac{-x^3\sin x - 2x\left(x\cos x - \sin x\right)}{x^4}$$

is undefined at zero. However, the top of the fraction will be negative
